CLINICAL ULTRASOUND REPORT - COMPLETE ABDOMEN

Patient Name: Jane Doe
Date of Exam: September 28, 2026
Age / Sex: 45 Years / Female
Accession No: US-2026-98745
Referred By: Dr. Robert Chen, MD
Sonographer: M. Johnson, RDMS

CLINICAL INDICATION: Right upper quadrant pain and mild dyspepsia.

TECHNIQUE: Real-time transabdominal gray-scale imaging of the upper abdomen was performed using multiple curvilinear transducers. Limited color Doppler interrogation was utilized where appropriate.

FINDINGS

LIVER:	Normal in size, shape, and overall contour. The parenchymal echogenicity and echotexture are homogeneous throughout without evidence of focal mass lesions, intrahepatic biliary dilation, or contour nodularity. Portal vein patency and directional flow are normal.
GALLBLADDER:	Normal distension with smooth, thin walls measuring 0.2 cm (within normal limits). The lumen is completely anechoic and free of shadowing cholelithiasis, sludge, or polyps. Sonographic Murphy's sign is negative.
BILE DUCTS:	The common bile duct is normal in caliber, measuring 0.4 cm at the porta hepatis. No extrahepatic or intrahepatic ductal dilation is identified.
PANCREAS:	The visualized portions of the pancreatic head, body, and uncinate process demonstrate normal size and uniform echogenicity. The pancreatic tail is partially obscured by overlying bowel gas, which is a common technical limitation. No masses or fluid collections are visualized.
SPLEEN:	Normal size and uniform parenchymal echo pattern. Splenic length measures 10.2 cm. No focal lesions are noted.

KIDNEYS:	**Right Kidney:** Normal position, size (10.5 cm), and corticomedullary differentiation. No evidence of nephrolithiasis, solid masses, or hydronephrosis. **Left Kidney:** Normal position, size (10.8 cm), and parenchymal thickness. No evidence of calculi, focal masses, or obstructive uropathy.
AORTA & IVC:	The upper abdominal aorta and inferior vena cava demonstrate normal course, caliber, and compressibility. Aortic diameter measures 1.8 cm without aneurysmal dilatation.
FREE FLUID:	No free fluid, ascites, or abnormal localized fluid collections are identified within the peritoneal cavities or retroperitoneum.

IMPRESSION

1. **Unremarkable complete ultrasound of the abdomen.**
2. **Normal size and echotexture of the liver, gallbladder, pancreas, spleen, and both kidneys.**
3. **No evidence of cholelithiasis, hydronephrosis, or abdominal ascites.**
